Proposal for the Universal Unit System

Takashi Suga, Ph.D.

January 18;(20.), 120Ɛ;(2026.) [1]

Abstract

This paper presents recent extensions and revisions to the Universal Unit System.[2] This system defines coherent units by employing the duodecimal number system (base 12) and fundamental physical constants, such as the speed of light in a vacuum, the quantum of action, and the Boltzmann constant. The central aim is to unify physical measurements (e.g., length, mass, temperature, and time) with a consistent duodecimal structure while accommodating human, atomic, and cosmic phenomena.

A noteworthy feature is the Harmonic System, which was conceptually designed so that crucial physical constants (including the Bohr radius and the atomic mass unit) and astronomical constants (including the year and day length of the Earth, the age of the solar system, and the universe) can be approximated using multiples or submultiples of integer powers of twelve. The Harmonic System simultaneously embraces duodecimal efficiency, atomic and cosmic relevance, and human convenience.

Compared to the previous official version, this revised document expands the discussion of calendar time units (such as "nodus "(=2^{-7} day)) by introducing new definitions and clarifications.

Additionally, the system identification for units has been shifted from the suffix to the prefix, and the identifier for the Harmonic System has changed from "h" to "±." The optional proposal to rename specific metric units after mythological figures, first introduced in the previous version, has been further refined in footnote 33 to address improved consistency.

This revision also clarifies the structural role of universal, Earth-local, and alias quartets, and resolves several common misunderstandings regarding the independence of UUS from CODATA and the scope of its notation system. Furthermore, since the 2019 redefinition of the SI—where the defining constants such as c_0, $\hbar$, k_B, and N_A were fixed—no subsequent revisions have altered these definitions. As a result, SI conversion factors for UUS have remained stable, with no changes even in the 2022 CODATA adjustment, which did not revise the gravitational constant.

0. Positioning Note

This revision improves the explicitness and consistency of the Universal Unit System (UUS) for systematic interpretation.

Note: This system is designed to **coexist with SI**, not replace it—offering a complementary educational perspective.

---

[1] In this paper, SI units are combined only with the decimal figures (indicated by a period "." as the fractional separator), and units of the Universal Unit Systems are combined only with duodecimal figures (indicated by a semicolon ";" as the fractional separator. 'Ƭ' expresses ten and 'Ɛ' expresses eleven). Both notations may use a comma "," and "_" as the digit group separator. Non-dimensional quantities are mostly expressed using all figures in duodecimal first, with the decimal given parenthetically. There are also cases where the octal fractional separator is represented by "∴". See also Appendix A.1 for aliases that can be used for non-ascii characters.

[2] NOTICE: The latest documentation and community discussions for the Universal Unit System (UUS) and the Harmonic System are now hosted on GitHub(👉Visit https://github.com/suchowan/a_converter).Please start with the new README for a conceptual overview and recent discoveries regarding cosmic harmony.

When describing a system, the initial choice of references such as origin, scale, or number base—is conventional. However, once such a choice is made, the structures that follow are no longer conventional: they emerge necessarily from internal consistency.

UUS adopts the duodecimal system as its number base.
Within this framework, the Harmonic System introduces a fixed offset to the Rydberg constant.

From these initial choices alone, the structural relationships summarized in Figure 2 follow inevitably. This document does not argue that these choices are uniquely correct. Rather, it shows that once they are adopted, the resulting structure is not arbitrary but constrained.

In this revision, the emphasis is therefore placed not on numerical adjustment, but on structural clarity: which elements of a unit system are universal, which are conventional, and which function as relations rather than quantities. To support this goal, the following clarifications are introduced:

・Units and relations

Some quantities traditionally treated as units are more naturally interpreted as conversion relations (e.g. solar, meridian). Making this distinction explicit reduces ambiguity rather than adding complexity.

・Canonical notation and aliases

Canonical symbols are used where unambiguous Unicode representations exist. Historical or socially established forms are retained strictly as documented aliases.

・Specified quantities

Certain socially meaningful measures (such as counting words or monetary units) are treated as specified quantities, not as members of the UUS core. This mirrors the role of specification already present in the SI definition of the mole.

These clarifications do not expand the scope of UUS. They make explicit assumptions that were previously implicit, improving interpretability for both human readers and computational analysis.

To maintain clarity across the UUS documentation set, if any discrepancy arises between this document and other files, the definitions and conventions in this revised.pdf should be regarded as authoritative.

1. The Universal Unit System

1.1. Before the Universal Unit System

A unit of measure is “a quantity that is used as the basis for expressing a given quantity and is of the same type as the quantity that is to be expressed”. A unit that is used in exchanges between people must be guaranteed to have a constant magnitude within the scope of that exchange. Quantities that can, by consensus, serve as common standards over a broad scope were sought and selected to serve as units. The ultimate example of such a quantity is an entity common to all of the humankind, the Earth itself, which was selected as the foundation for the metric system.

1.2. The next stage?

Of course, we can consider going beyond the framework of the Earth and defining units with concepts for which agreement can be reached within a broader scope. The quantities that then become available to serve as the standards for defining units include the quantities of the fundamental physical constants, quantities such as the speed of light in a vacuum (c_0), the quantum of action ($\hbar$), the Boltzmann constant (k_B), and so on. These quantities are believed to have values that remain constant everywhere in the universe. When trying to construct a coherent unit system, however, it is not possible to use all of the fundamental physical constants in the definitions of units. Therefore, would not we expect the fundamental physical constants that were not used in defining units to have fractional magnitudes of unit quantities of the same dimension?

For example, the Rydberg constant (R_∞) is 115,3789;470075/ft (10973731.56816/m) [3] and the Bohr radius (a_B) is 0;X8EE6E522×10;$^{-9}$ft (5.29177210544×10.$^{-11.}$ m). Therefore, the relation between these two constants is:

DOZENAL	DECIMAL	
R_∞^{-1} = EE6;06604 a_B	$R_\infty^{-1} = 1{,}722.04515\ a_B$	(1)

If one of these two constants is chosen as a unit quantity, the other constant cannot be expressed as a unit quantity.

By surprising coincidences[4] described in Appendix F and §2.1 of http://dozenal.com, however, if the duodecimal number system is used to express the speed of light in vacuum and the quantum of action as the defining constants such that these constants are strictly multiples of integer powers of twelve of the unit quantities, it is possible to construct a coherent unit system in which not only the constant that was used in the definition but also the Rydberg constant, the Bohr radius, the unified atomic mass unit (u), and half the value of the Planck length ($l_P/2=\sqrt{36.G\hbar/c_0^3}/12.$) can be approximated to about or within an error of 2 per gross ($1^1/_2$%) by a multiple of integer powers of twelve of the unit quantities.

In that case, many other physical constants, including the charge and mass of an electron, the fine structure constant, the molar volume of an ideal gas under standard conditions, the black-body radiation at the ice point, the density and surface tension of water, and others, can be approximated by multiples of integer powers of twelve of the unit quantities. Moreover, by adding the Boltzmann constant and using it in the definition of thermodynamic temperature, the gas constant of an ideal gas can be approximated by a multiple of an integer power of twelve of the unit quantity and the Stefan-Boltzmann constant, and the specific heat of water can be approximated by multiples of integer powers of twelve of the unit quantities with a factor 2 remaining. These conclusions are

[3] In this paper, plane angle phase factor 2π is often treated as a non-dimensional parameter and omitted in order to simplify the explanation. See §A.2 and 3.2.2 of the paper http://dozenal.com .

[4] To prevent any misunderstanding, let us emphasize that **these are merely coincidences as far as physical science is concerned**.

shown in Table 5.[5]

For putting these coincidences to use, the duodecimal number system is the only choice. It seems that the combination of fundamental physical constants "forces" us to use base twelve.

We define the Universal Unit System as "the unit system that is constructed by using the duodecimal number system and the speed of light in vacuum, the quantum of action, and the Boltzmann constant as the defining constants in such a way that these constants become strict multiples of integer powers of twelve of the unit quantities, and the Rydberg constant, the unified atomic mass unit, the Bohr radius, and half the value of the Planck length can be approximated by multiples of integer powers of twelve of the unit quantities".

1.3. Variation of the Universal Unit Systems

To define three units for time, length, and mass, the Universal Unit System uses the speed of light in vacuum and the quantum of action. Another constant is necessary to define these three units. Therefore, the Universal Unit System has some variations in the constant that the system chooses as the last definition constant.

Universal Unit System with constant A is the Universal Unit System that uses constant A as the last definition constant and whose unit quantity of the last dimension is equal to constant A or its multiples of integer powers of twelve. In particular, the Universal Unit System with the Rydberg constant whose length unit is $10;^{6} / R_\infty$ ($12.^{6} / R_\infty$) and velocity unit is $10;^{-8}\ c_0$ ($12.^{-8}\ c_0$) is called the Universal System of Units Standard[6] corresponding to the International System of Units Standard (SI). We will use a symbol corresponding to the SI unit symbol prefixed with 'u' as a new symbol required by the Universal System of Units Standard; 'u' is the '**u**niversal' system prefix. The noun form is 'univer'. For example, the length unit is $_{\mathrm{u}}$m and is called the 'universal meter' or simply the 'univer'[7], and the time unit is $_{\mathrm{u}}$s and is called the 'universal second'[8]. **This unit system is comprised of six quartets.** The units of this system are listed in the 5th column of Table 4, and physical, material, and astronomical constants expressed using this system are presented in the 3rd column of Table 5. The ratio of the time unit $\mathrm{s_u}$ and the SI second is 0;4824707(0.3902675).

The Universal Unit System with the Bohr radius whose length unit is $10;^{9}\ a_\mathrm{B}$ ($12.^{9}\ a_\mathrm{B}$) and velocity unit is $10;^{-8}\ c_0$ ($12.^{-8}\ c_0$) can be defined in the same way. Its time unit is 1;005E857 $_{\mathrm{u}}$s

---

[5] A more detailed table is retrievable at https://github.com/suchowan/a_converter/blob/master/doc/condensed.xlsx.

[6] The Universal System of Units Standard is strictly defined in §3 of the paper http://dozenal.com.

[7] The noun form of the system prefix is considered to be the abbreviation of the length unit like the length unit of the metric system is 'meter'.

[8] Note that there is no vagueness at all even if the prefix is omitted if the notation of footnote 1 is adopted. Prefixes are necessary to identify plural Universal Unit Systems mutually. $4\times10.^{7}$ m, $4\times10;^{7}$ $\mathrm{m_u}$, and the Earth's meridian length are nearly equal. $10.^{5}$s, $10;^{5}$ $_{\mathrm{u}}$s, and 1⅛ days are nearly equal.

(0.3916171 s). Roughly speaking, **if a time constant or its multiples of integer powers of twelve falls within the range between 1; $_{\mathrm{u}}$s (0.3902675 s) and 1;005E857 $_{\mathrm{u}}$s (0.3916171 s), we can construct the Universal Unit System using the constant as a time unit.**

If half the value of the Planck length is used instead of the Bohr radius, the time constant becomes 1;0223 $_{\mathrm{u}}$s (0.3962 s). This is out of range. To keep the time constant within the range, we should use $\sqrt{\mathbf{35.}G\hbar/c_0^3}$ instead of $\sqrt{\mathbf{36.}G\hbar/c_0^3}$. Then, the time constant becomes 1;00186 $_{\mathrm{u}}$s (0.39065 s). We call this system the Gravitic System. The Gravitic System can be interpreted as a unit system that 35.G, c_0, $\hbar$, K_B and Z_P are strict multiples of integer powers[9] of twelve of the unit quantities. However, it is not practical because G's measurement accuracy is insufficient.

2. The GCD Unit System

2.1. Basic Concept

The length of the tropical year is strictly 265;2XX6 days in a certain year at the end of the 20th century. For human activities on Earth, year and day cannot be ignored as calendar time units. However, the ratio of year and day is not simple. **Therefore, any calendar time unit system must be a mixed radix system.** The ratio of one tropical year and one day is:

DOZENAL

$$\frac{\text{year}}{\text{day}} = 265; + \frac{27;}{X8;} = 1;003628 \times 264;6 = 1;003628 \times \frac{3^6}{2}$$

DECIMAL (2)

$$\frac{\text{year}}{\text{day}} = 365. + \frac{31.}{128.} = 1.002036.. \times 364.5 = 1.002036.. \times \frac{3^6}{2}$$

Because one year consists of twelve months, it is reasonable to adopt twelve as one of the radixes. Though this ratio contains the extra factor 3 six times,[10] by multiplying by factor $2^6 (= 8 \times 8)$ twice, we can cancel factor 3 and obtain powers of twelve$(= 3 \times 2 \times 2)$:

DOZENAL

$$\frac{2^6\text{year}}{2^{-6}\text{half day}} = 2^6 \times 1;003628 \times \frac{3^6}{2} \times 2^7 = 1;003628 \times 10;^6$$

DECIMAL (3)

$$\frac{2^6\text{year}}{2^{-6}\text{half day}} = 2^6 \times 1.002036.. \times \frac{3^6}{2} \times 2^7 = 1.002036.. \times 12.^6$$

[9] If these integers are all set to 0, various constants are approximately expressed as follows: https://en.wikipedia.org/wiki/Talk:Planck_units/Archive_3#Other_possible_normalizations .

[10] Yang Xiong (45;(53.) BCE–16;(18.)) used the ratio $3^6/2$ in his Tai Xuan calendar (太玄暦).

See Hideki Kawahara "Chinese Scientific Thought (中国の科学思想)" 11X4;(1996.) [ISBN: 978-4423194126] and Wikipedia http://en.wikipedia.org/wiki/Yang_Xiong_(author).

If we define ‘hexon’(=octal century, symbol: ⌬) as 2^6 years, and define ‘nodus’ (symbol: ☆) as 2^{-6} of a half day[11], the relation between these two units is:

$$\text{hexon} = 1;003628\times 10;^{6}\ \text{nodus} \qquad (4)$$

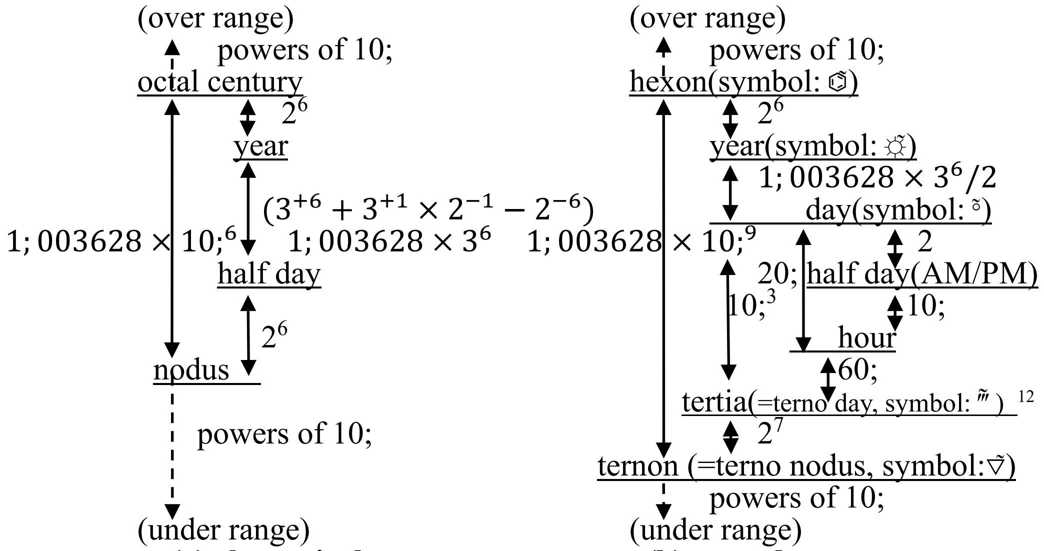
There are some interesting coincidences. Also, please see Table 1.

- One nodus is the difference between a tropical year and a Julian year.
- One nodus is the greatest common divisor (GCD) of the length of a day and a tropical year.
- Two octal centuries are the least common multiple (LCM) of the length of a day and a tropical year, and so leap year rules become simpler than those of the Gregorian calendar.
- The geometric mean of one octal century and one nodus is approximately one fortnight.

Table 1 Coincidences of rotation and revolution of Earth and other planets

Quantity A	Quantity B	Type	Common Quantity
day	Julian year	GCD	1/4 day
		LCM	4 years
	tropical year	GCD	1/X8;(2^{-7}) day
		LCM	X8;(2^7) years
year	rotation of Venus	LCM	2 years and -3 rotations
	revolution of Venus		8 years and 11;(13.) revolutions
	revolution of Mars		28;(2^5) years and 15;(17.) revolutions

It seems that the combination of the rotation and revolution of the Earth “forces” us to use base two in the middle of the calendar time range. People have a proclivity for using large units for large quantities and using small units for small quantities, so we can cover a wide calendar time range by a duodecimal number system using the following hierarchy shown in Figure 1 (a).



(a) theoretical **(b) everyday use**

Figure 1 The GCD Unit hierarchy

---

[11] The Latin word ‘nodus’ signifies a knot or node, a point where multiple lines or elements intersect. See the Natural Time Scale Chart in Appendix E. The neologisms ‘hexon’ (nearly10;$^{+6}$ nodus) and ‘ternon’ (10;$^{-3}$ nodus) were coined by abbreviating hexa[6]on[+]nodus→hex(a)on n(odus)→hexonn →hexon, and ter[3]no[-]nodus→terno n(odus)→ternon, respectively. See Appendix A.2 and blog post: https://suchowan.seesaa.net/article/202501article_17_3.html.

[12] A terno day(‘tertia’) is equal to H. C. Churchman's ‘moment’. Please see http://www.dozenal.org/archive/DuodecimalBulletinIssue112-web.pdf .

We define ‘the GCD Unit’ as “the GCD of the length of a day and a tropical year, or its multiples of integer powers of twelve”, and ‘the GCD Unit System’ as “the 2:10;(2:12.) mixed-radix calendar time system using a day, a tropical year, and the GCD Unit”. **It is very natural to adopt a unit of calendar time that is an integer division of both a year and a day.**

2.2. Everyday use

Calendar time units are the most conservative units. Considering the easiness of the shift from the present 10;:50;(12.:60.) mixed-radix system to the future 2:10;(2:12.) mixed-radix system, there are some variations of connection points of the binary number system and duodecimal number system[13]. A variation designed for everyday use is shown in Figure 1 (b) and Table 8.

$$1 \text{ day} = 10;^{3} \text{ tertias} = 10;^{3}\times 2^{7} \text{ ternons} \qquad (5)$$

This is a variation that is designed to maximize the range expressed by multiples of integer powers of twelve of a day. This permits ‘half day(AM/PM)’ and ‘hour’ to be used for clock notations. That is, the following four clock notations are all available. The notation ‘hour’ may fade out.

Table 2 Clock Notations

clock notation	format	2:10;(2:12.) system	10;:50;(12.:60.) system
10;-hour notation	H:TT$^{\tilde{\prime\prime\prime}}NN^{\triangledown}$nn…(AM/PM)	3:16$^{\tilde{\prime\prime\prime}}$ 28$^{\triangledown}$0 PM	3:15:12.5 PM
20;-hour notation	HH:TT$^{\tilde{\prime\prime\prime}}$ NN$^{\triangledown}$nn…	13:16$^{\tilde{\prime\prime\prime}}28^{\triangledown}$0	15:15:12.5
1000;-tertia notation	UTT$^{\tilde{\prime\prime\prime}}$ NN$^{\triangledown}$nn…	776$^{\tilde{\prime\prime\prime}}28^{\triangledown}$0	Not used
10;-unitia notation	TT(to[-]/past[+])U	46; tertias to the 8th unitia	15 minutes past 3 PM

Following the Titius-Bode law, the orbital semi-major axis of planets can be approximated by $(3 \times 2^{N} + 4)$ light solar tertias (see also Table 8), where N = -∞,0,1,2,4,5,6 (Mercury, .., and Uranus). Ratio 2^{7}:1 is the same as the ratio of the U.S. liquid gallon and fl oz. **The Harmonic Ratio 2^{7}:10;^{2} (2^{3}:3^{2})** corresponds to the major tone of the just intonation.

3. The Harmonic System

3.1. Emergence of the Harmonic System

The GCD Unit is derived from the combination of the rotation and revolution of the Earth without using the Universal Unit System concept. However, we encounter the final surprising coincidences. 1; ternon is equal to a day/(10;$^{3}\times 2^{7}$). It is equivalent to 1;0016EE1 $_{u}$s (0.3906250 s). Therefore the equivalent value of 1; ternon falls within the range between 1; $_{u}$s (0.3902675 s) and 1;005E857 $_{u}$s (0.3916171 s). This value also almost agrees with the time constant of the Gravitic System 1;0018 $_{u}$s (0.3906 s). We can construct the Universal Unit System with the GCD Unit! [14] The Dozenal Society of America seems to recommend ‘dour’(day/10;) and ‘moment’(day/10;^{3}). Of

---

[13] See detailed discussion in https://www.tapatalk.com/groups/dozensonline/the-universal-unit-system-f34/.

[14] See the sheet ‘Clock’ in https://github.com/suchowan/a_converter/blob/master/doc/condensed.xlsx.

course, these units are all available, but because the calendar time unit system includes ‘year’ by all means, it does not become a pure duodecimal system even if we choose 1/10;[2] of ‘moment’ as a unit. **We can enjoy all the advantages of Table 5 if we choose not 1/10;[2] but 1/2[7].**

Because of tidal friction, the physical time length of a day is not constant and becomes longer little by little.[15] A length unit can be redefined exactly as 100,1700;/R_∞ so that a physical time unit becomes exactly 1;001700 ${}_{u}\mathrm{s}$ (0.3906251 s) and approximately 1;0016EE1 ${}_{u}\mathrm{s}$ (0.3906250 s) similar to the redefinition of SI units to provide better stability and reproducibility. The calendar time unit length will strictly correspond to the physical time length of a day about 20; octal centuries (1400. years) later. We call this redefined system ‘the Harmonic Universal Unit System with the GCD Unit’, or simply ‘the Harmonic System’ and will use the prefix ‘±’ for units of this system[16]. The length unit is ${}_{\pm}\mathrm{h}$ and is called ‘harmonic universal meter’, ‘harmonic meter’, or simply ‘harmon’. We specifically granted dedicated aliases for the Harmonic System’s length, time, mass and impedance unit. Please see footnote 30 on ‘harmon’(${}_{\pm}\mathrm{h}$), ‘nic’ (${}_{\pm}\mathrm{n}$), ‘looloh’ (${}_{\pm}\mathrm{l}$) and ‘nohm’(${}_{\natural}\Omega$).

We notice that the Harmonic System is also a unit system that redefines the Gravitic System which is not practical because G’s measurement accuracy is insufficient. In other words, the Harmonic System can also be said to have given a strict and practical definition to the conceptual Gravitic System.

The units of this system are listed in the 7th column of Table 4 and physical, material, and astronomical constants expressed using this system are presented in the 4th column of Table 5. Please see also Table 6 and Table 7 for details. The approximations shown in Table 5 are remarkable. For putting coincidences described in this paper to use, the duodecimal number system is indispensable. **We hope that the Harmonic System is acceptable for humans on Earth.**

Although the structure of the Harmonic System follows almost entirely from the initial choices, one element—the Earth-local temperature scale T_E—remains the only deliberately chosen component. It completes the quartet structure without altering the universal derivation.

3.2. Clarifications and Common Misunderstandings

The Harmonic System and the Universal Unit System (UUS) are sometimes described—incorrectly—as “based on CODATA”. This misunderstanding arises because many physical constants, when expressed in UUS, appear numerically close to simple dozenal powers. However, this numerical proximity is a consequence of the internal structure of UUS, not its dependence on CODATA.

UUS does not rely on CODATA values. Its definitions are structural and proportional, derived from universal constants and dimensional relations. If CODATA updates its recommended values, the definitions of UUS remain unchanged. Only the *conversion factors from UUS to SI* shift accordingly, because SI is defined by fixing numerical values of CODATA constants such as c_0, h, k_B, and N_A.

---

[15] See Stephenson, F. R.; Morrison, L. V. (April 11X3;(1995.)) “Long-term fluctuations in the Earth's rotation: 700 BC to AD 1990.” retrievable at http://adsabs.harvard.edu/abs/1995RSPTA.351..165S .

[16] In principle, the prefix ‘±’ is pronounced as ‘harmonic.’ However, if the unit is the same amount in both the Universal and Harmonic systems, it is pronounced as ‘universal.’ For example, ‘${}_{\pm}\mathrm{A}$’ is ‘harmonic Ampere,’ but ‘${}_{\pm}\mathrm{C}$’ is ‘universal Coulomb.’ Also, if the context tells you it is a Harmonic System unit, you do not need to pronounce ‘±.’ For example, in the voltage unit ‘${}_{\natural}\Omega_{\pm}\mathrm{A}$,’ when you read ‘${}_{\natural}\Omega$’ as ‘nohm,’ you know that the next unit is not an SI but a Harmonic System unit so that you can pronounce it as ‘nohm Ampere’ instead of ‘nohm harmonic Ampere.’

Thus:

- **UUS is CODATA-independent.**
- **SI is CODATA-dependent.**
- **UUS → SI conversion coefficients reflect SI's revisions, not changes in UUS.**

This distinction is essential for understanding the philosophical independence of UUS. The Harmonic System is not tuned to match CODATA; rather, CODATA's values happen to lie near the natural dozenal structure revealed by UUS. See also blog post: https://suchowan.seesaa.net/article/201410article_11_1.html.

A further source of misunderstanding concerns the perceived "lack of coverage" in UUS. This impression arises from the naming style of some historical systems, in which conceptual quantity names are reused as unit names, creating an illusion of completeness. UUS deliberately avoids this practice: its vocabulary is intentionally minimal, with coverage provided structurally rather than lexically. In practice, the online converter supplies a far broader and more up-to-date catalog of definitions and relations than any paper-based system could maintain, eliminating the need for an inflated unit vocabulary.

Figure 2 summarizes the eight quartets that define the layered structure of the Harmonic System and its surrounding domains, including universal constants, Earth-local quantities, physical interactions, and socially motivated aliases.

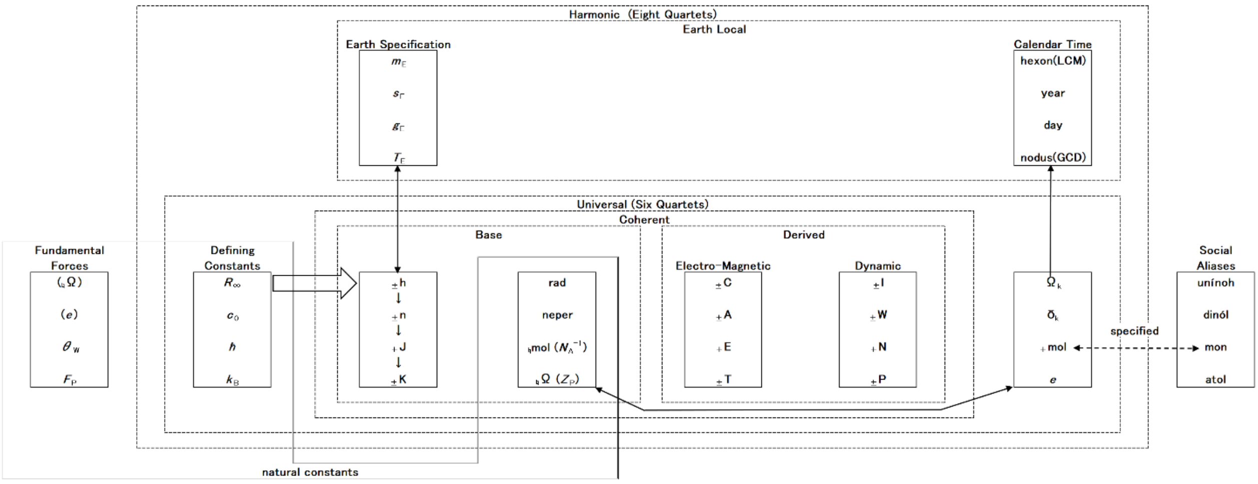


Figure 2 Eight quartets that define the layered structure of the Harmonic System

(A high-resolution version is available at GitHub: Eight_Quartets.png)

A. Notation

This appendix explains the notation policy of the Universal Unit System (UUS), with particular emphasis on the controlled use of aliases.

A.1. Aliases, and the Principle of Specification

UUS is designed as a coherent, closed system of definitions. At the same time, it must coexist with legacy notation, social conventions, and historically accumulated vocabularies. Aliases are therefore not accidental conveniences, but deliberate interface elements between UUS and its surrounding cultural, linguistic, and technical environments. This appendix clarifies: why aliases are permitted, where they are explicitly limited, and how they differ from core UUS definitions.

(1) Canonical Symbols and Unicode Policy

Whenever a symbol has an unambiguous and semantically appropriate Unicode character, that character is treated as the canonical notation. Well-known examples include:

・↊(x218A) and ↋(x218B) as the canonical digits for decimal ten and eleven in dozenal notation(with X and E retained strictly as aliases),

・∴(x2234) as the canonical symbol for the octal fractional separator(with @ retained as a historical and practical alias),

・♭,♮,♯(x266D-F) and ±(x00B1) used consistently as semantic modifiers rather than decorative marks. For a detailed account of the naming rationale and the introduction of musical-symbol metaphors, see the accompanying note "The Day Musical Symbols Fell Naturally into Place"(https://suchowan.seesaa.net/article/202601article_10_1.html).

The existence of aliases for core UUS symbols does not weaken the canonical symbol. Rather, it acknowledges historical inertia, input-method constraints, and the reality of legacy documents. Aliases are therefore documented, not encouraged. Calendar time symbols are excluded from this policy: they are numerous and always have pronounceable lexical forms, so ASCII aliases are neither necessary nor intended.

(2) Aliases Are Not New Units

This appendix—and the corresponding category in units.pdf—does not introduce new units as UUS members. Instead, it documents aliases of existing UUS units, socially entrenched names for specified quantities, and context-dependent shorthand forms. The distinction is essential:

・UUS units are defined by physical constants and formal relations.

・Aliases are linguistic or cultural handles applied to those definitions.

This distinction prevents uncontrolled growth of the system while allowing it to remain usable.

(3) Aliases and Controlled Vocabulary Growth

One motivation for explicitly listing aliases is to prevent uncontrolled proliferation. In several historical dozenal and alternative-unit communities, informal or "colloquial" names multiplied without clear constraints, making systems appear opaque to outsiders.

UUS therefore adopts a psychological and structural boundary: a small, clearly delimited set of socially motivated aliases is acknowledged, further invention is neither prohibited nor endorsed, but remains outside the documented system. The last category in units.pdf is organized based on this principle.

(4) "Specified" Quantities (mol as Prototype, mon as a Deliberate Non-UUS Unit)

The concept of specification plays a central role. In the SI definition of the mole, the phrase "elementary entities (must) be specified" makes it clear that a mole is not merely a number, but a number applied to a named entity.

This allows rigorous reinterpretation: A counter word such as the Japanese hon (本) in "one pencil" can be understood as an alias of a specified mole: ♮mol_pencil.

Although this interpretation is rarely stated explicitly, it is fully consistent with the SI definition itself. Thus, everyday counting words can be seen as social aliases of specified amounts, not as conceptually separate objects.

The monetary unit mon is intentionally introduced outside the UUS as an example of "Specified" Quantity. It is a genuine addition, not merely a renaming. However, it is excluded from the UUS core by design. Its purpose is didactic: to illuminate the structure of mol by analogy, to demonstrate how "specified quantity" works in a familiar domain, and to clarify why exactness matters in some social contexts.

For example: mon_US is socially aliased to US cent[17]. In this sense, mon functions as a conceptual mirror of mol, not as an expansion of the UUS itself.

(5) Rational Units for Logarithmic and Geometric Quantities (Ʊ, f, and Ω)

For logarithmic measures of integer magnitude: Ʊ is adopted as the canonical symbol, reflecting the deep relation between logarithms and complex-plane structure[18], f (from figure) is retained as an alias, reflecting its established meaning as "number of digits". For the background and rationale behind these naming choices, see the accompanying note "Some Details on the Rational Unit Ʊ$_1$ for Logarithmic and Information-theoretic Quantities" (https://suchowan.seesaa.net/article/202601article_19_1.html).

Because practical usage always includes a suffix (e.g. Ʊ$_1$ = bit, Ʊz = dozenal digit), there is no risk of confusion with electrical conductance. This mirrors earlier decisions where: canonical notation was strengthened, while aliases were preserved for continuity.

In natural language, the words cycle and turn are often used interchangeably. In UUS, however, they are assigned distinct structural roles: cycle(Ω_1) as one-dimensional rotation (plane angle), turn(Ω_2) as two-dimensional rotation (solid angle). These assignments are conventional but structurally motivated. See also Ref.18§E.4 Fig. 2.

(6) Effective Units and Human Sensitivity (overline)

Certain perceptual quantities—such as luminous flux, perceived sound pressure, or equivalent dose—are expressed in an effective form, indicated by an overline (̄)[19]. In this framework, the SI lumen corresponds to an effective watt weighted by the dimensionless human visual sensitivity function, rather than to a distinct base or derived unit.

(7) Aliases as Interfaces, Not Weaknesses

Aliases should be understood as interfaces, not compromises. They allow: legacy users to recognize familiar forms, newcomers to transition gradually, and formal definitions to remain uncompromised. UUS therefore treats aliasing as a design layer, distinct from the definition layer. Several social aliases, introduced independently, converge in suffix form due to the system's structural constraints.

(8) Summary

This appendix clarified how UUS distinguishes

- canonical units,
- aliases,
- specified quantities,
- and perceptual extensions,

without expanding the UUS core.

---

[17] Not to the dollar, because the cent is not a finite base-12 fraction and would introduce intolerable conversion ambiguity.

[18] See https://github.com/suchowan/a_converter/blob/master/doc/dozenal_com/univunit-e.pdf § A.2.

[19] See examples in **Table 7** and Appendix E.

A.2. Number Counting

(1) Design Principles

The number-counting system of UUS is designed to balance three requirements:

- Compatibility with existing linguistic intuition
- Predictability and transparency for new learners
- Avoidance of uncontrolled vocabulary growth

The duodecimal myriad system introduced in this Appendix follows these principles. It reuses familiar morphemes such as -llion where possible, while drawing from classical Greek and Latin roots not adopted in English, thereby avoiding collisions with existing words. The paired endings -on (positive powers) and -no (negative powers) form a visually and semantically coherent duality, analogous to established pairs such as neutron and neutrino.

A deliberate design choice is that no artificial words are introduced for single-digit powers. This ensures that even first-time readers can infer meaning from context. Conversely, forms such as uni-on and uni-no are avoided because their values differ by only two dozenal orders, making them likely to appear in the same context and therefore prone to confusion. Similarly, prefixes such as di- and ter- share etymological roots and are unsuitable for high-frequency usage where clear visual distinction is required.

The system adopts an octal step rather than a dozenal step for large-scale grouping. Although this may appear unfamiliar to strict dozenal purists, a dozenal step would inevitably produce forms such as octallion or octollion, which lie uncomfortably close to existing English words and are therefore unsuitable. The octal step avoids these lexical collisions while preserving regularity, readability, and long-term stability of the nomenclature.

In summary, the number-counting system is designed not merely as a naming scheme but as a controlled, psychologically stable vocabulary. It minimizes ambiguity, prevents proliferation of near-synonyms, and maintains coherence with the broader philosophy of UUS.

(2) Specification

Many of the constants introduced in footnote 9 often have orders $8n-1$.[20] Therefore, it is convenient to use the factor U(=10;^{8}(12.^{8})) to make the units of the Universal Unit System into human scale. The factor U can be regarded as a conversion factor between atomic scale, human scale, and cosmic scale. Since power 8(=2^3) is a power of 2, the decimal myriad system[21] has affinity for our system. So, we propose a duodecimal myriad system in Table 3 [22] replacing ten/hundred with dozen/gross. Larger

[20] See also footnote 38.

[21] http://en.wikipedia.org/wiki/-yllion .

[22] "∴"is the octal fractional separator.

numbers consist of uni(1),di(2),ter(3),tetra(4),penta(5),hexa(6),hepta(7), lli(0) [23],on(+), and reciprocals are expressed by replacing on(+,positive power) with no(-,negative power)[11].

Table 3 Duodecimal myriad system

decimal	dozenal		read as 'one-'	origin of prefix part	decimal	dozenal		read as 'one-'	origin of prefix part
$12.^{1.}$	10;		dozen	Old Norse	$12.^{-1.}$	$U^{-\therefore 1}$	1;′	unino	Latin
$12.^{2.}$	100;		gross	Old French	$12.^{-2.}$	$U^{-\therefore 2}$	1;″	dino	Greek
$12.^{3.}$	1000;		doz gross		$12.^{-3.}$	$U^{-\therefore 3}$	1;‴	terno	Latin
$12.^{4.}$	1,0000;	1,;	myriad	Greek	$12.^{-4.}$	$U^{-\therefore 4}$	1;,	tetrano	Greek
$12.^{5.}$	10,0000;	10,;	dozen myriad		$12.^{-5.}$	$U^{-\therefore 5}$	1;,′	pentano	Greek
$12.^{6.}$	100,0000;	100,;	gross myriad		$12.^{-6.}$	$U^{-\therefore 6}$	1;,″	hexano	Greek
$12.^{7.}$	1000,0000;	1000,;	doz gross myriad		$12.^{-7.}$	$U^{-\therefore 7}$	1;,‴	heptano	Greek
$12.^{8.}$	U	1_;	unillion		$12.^{-8.}$	U^{-1}	1;_	unillino	
$12.^{16.}$	U^{2}	$1_{=}$; or 1__;	dillion		$12.^{-16.}$	U^{-2}	1; $_{=}$or 1;__	dillino	
$12.^{24.}$	U^{3}		terllion		$12.^{-24.}$	U^{-3}		terllino	
$12.^{32.}$	U^{4}		tetrallion		$12.^{-32.}$	U^{-4}		tetrallino	
$12^{.40.}$	U^{5}		pentallion		$12^{.-40.}$	U^{-5}		pentallino	
$12.^{48.}$	U^{6}		hexallion		$12.^{-48.}$	U^{-6}		hexallino	
$12.^{56.}$	U^{7}		heptallion		$12.^{-56.}$	U^{-7}		heptallino	
$12.^{64.}$	$U^{10\therefore}$		unillillion		$12.^{-64.}$	$U^{-10\therefore}$		unillillino	
$12.^{72.}$	$U^{11\therefore}$		uniunillion		$12.^{-72.}$	$U^{-11\therefore}$		uniunillino	
$12.^{128.}$	$U^{20\therefore}$		dillillion		$12.^{-128.}$	$U^{-20\therefore}$		dillillino	
…	…		…		…	…		…	

For example, 1_2345,6789; is read as 'one unillion two doz three gross four dozen five myriad six doz seven gross eight dozen nine'. The first 'one' should not be omitted. The term 'dozen' is abbreviated as 'doz' when it appears in the $10;^{4n-1}$ position. The expression 'Unillion to the power of *octal number*' is also used as exponential expression[24]. For example, $1;2\times U^{3\therefore 4}$ is read as 'one point two times unillion to the power of three point four'. '∴4' can also be written 'H', in which case 'H' is read as 'and half'. The characters "′ ", "″ ", "‴ " , ", " and (diacritical mark)"_" following a fractional separator or digit group separator[1] shift them by 1, 2, 3, 4, and 8 places, respectively. [40]

B. The Earth local extension

The Earth local extension, which consists of four unit series, and three supplementary constants, is designed for local use on Earth. Please see Table 8.

In this scheme, the CGD unit system is treated as part of the Earth local extension. **To distinguish calendar time units from physical time units, we regard the dimension of calendar time units as the plane angle.**[25]

---

23 The choice lli- = 0 in the duodecimal myriad system was inspired by the SDN concept of "nil," and is retained as a historical design note.

24 Dr. Isaac Asimov made a similar proposal called 'T-formation'. See http://www.isfdb.org/cgi-bin/title.cgi?62431 and http://www.arvindguptatoys.com/arvindgupta/asimov-on-numbers.pdf .

25 See Seaman, Rob (April 11XB;(2003.)). "A Proposal to Upgrade UTC" retrievable at https://web.archive.org/web/20150419125423/http://iraf.noao.edu/~seaman/leap/. It seems that the dimension of

A new temperature unit, °H (degree H), is introduced under the "Earth local extension" category to accommodate everyday use within the universal system. We define 0 °H at T_E (=118,2354;±K (approximately -74.36°C, -101.85°F)) , and set 100; °H to match the boiling point of water (99.9839 °C). Consequently, 1 °H interval corresponds exactly to 1 **H**yper Kelvin (=1,0000;± K≑1.210724 K). This arrangement ensures that typical ambient temperatures on Earth remain in a convenient positive range, avoiding negative values for everyday measurements. While some may question the choice of offset and the use of $10;^2$ as the boiling point reference, this design balances the duodecimal scaling of the universal system with practical concerns for daily life. H is an initial letter for both the Hyper and Human scale.

The supplementary constant g_E is used to represent any force quantity as a corresponding mass quantity, like 1±1 g_E (one looloh gee). In the same way, the supplementary constants s_E and m_E are used to represent any physical time and length quantity as a corresponding plane angle quantity.

C. Gravitational constant and gravity field equations

The equations of some categories[26] can be used efficiently if we introduce new constants. At this time, the total solid angle of a sphere[27], Ω_2, and the speed of light in vacuum, c_0, appear in the equations. This is the reason that the speed of light in a vacuum should strictly be multiples of integer powers of the base number of the unit quantities.

When representing the mass of a celestial body using the Universal Unit System, the gravitational radius (half the Schwarzschild radius) is used rather than using mass directly. Because the accuracy of measuring the Newtonian constant of gravitation is poor, representing the mass of a celestial body directly in terms of mass results in poor accuracy, but the gravitational radius can be measured to an accuracy of around ten digits.

If we define a new constant that has the dimension 'force' as 'the Planck force', there is a good chance that the geometrical parts can be separated from the coefficients in the formula[28]. Make the Planck force, $F_P = c_0^4 G^{-1} = \hbar c_0 / l_P^{\,2} = 35.\hbar c_0 / m_G^{\,2}$, then:

gravitational radius, $r_m = \frac{Gm}{c_0^2} = \frac{mc_0^2}{F_P}$ (half the Schwarzschild radius) (6)

gravitational force, $f = F_P \frac{r_m r_{m'}}{r^2} = c_0^2 \frac{r_m m'}{r^2}$ (7)

gravitational acceleration, $g = c_0^2 \frac{r_m}{r^2} = \frac{r_m}{(r/c_0)^2}$ (8)

gravity field equation, $\frac{T_{ik}}{F_P} = \frac{1}{2\Omega_2}\left(R_{ik} - \frac{1}{2} R g_{ik} + \Lambda g_{ik}\right)$ (9)

---

the quantity of a day (=calendar time) should be a plane angle rather than physical time. The calendar time is, in a word, the rotation angle of the Earth derived by using the direction of the sun as a coordinate origin.

[26] For a case of electromagnetism, see §B of the paper http://dozenal.com. In the electromagnetic field, the natural unit of impedance, ♮Ω (=Z_P: the Planck impedance), plays the role of the Planck force in the gravitational field. ♮Ω, e, θ_W, and F_P are constants for the four fundamental forces.

[27] See electromagnetic units in Appendix E and §3.2.2 of the paper http://dozenal.com, and https://github.com/suchowan/a_converter/blob/master/doc/dozenal_com/electromagnetism.pdf .

[28] Please note that Eq. (8) and (9) are geometrical and have no mass dimension.

D. Tables

Table 4 Units with special names and symbols[29]

ALL VALUES DECIMAL

	Unit Category	Dimension	The Universal Unit Systems: with the Rydberg constant(u)		Harmonic System (±)	
Coherent	base units that are not natural units	length	$_{u}$m	272.102883 mm	$_{\pm}$h [30]	272.352206 mm
		time	$_{u}$s	390.267520 ms	$_{\pm}$n	390.625115 ms
		energy	$_{u}$J	64.143275 mJ	$_{\pm}$J	64.084556 mJ
		temperature [31]	$_{u}$K	58.441041 μK	$_{\pm}$K	58.387542 μK
	base units that are natural units	plane angle	rad	(2/π) arc sin(1)		
		logarithm	neper	log(e)		
		amount of substance	$_{\natural}$mol or N_A^{-1}	mol / 6.02214076×10.[23.] In this context '♮' is equivalent to '3-' and $_{\natural}$mol is called 'natural mol.'		
		impedance	$_{\natural}\Omega$ or Z_P	29.979245796 Ω (=1sr/($\varepsilon_0 c_0$) [32]) $_{\natural}\Omega$ is called 'natural ohm' or more simply 'nohm.'		
	derived units of electromagnetic quantities	charge	$_{\pm}$C	28.896578 mC (may be called 'universal Coulomb' (or 'Clio' [33]))		
		electric current	$_{u}$A	74.043001 mA	$_{\pm}$A	73.975219 mA
		field strength	$_{u}$E [27,33]	272.113988 mA/m	$_{\pm}$E	271.616007 mA/m
		flux density	$_{u}$T	390.283447 mC/m²	$_{\pm}$T	389.569211 mC/m²
	derived units of dynamical quantities	mass	$_{u}$g	131.950082 g	$_{\pm}$l (x006C)	131.829289 g
		power	$_{u}$W	164.357196 mW	$_{\pm}$W	164.056415 mW
		force	$_{u}$N	235.731701 mN	$_{\pm}$N	235.300301 mN
		Pressure	$_{u}$P	3.183843 Pa	$_{\pm}$P	3.172201 Pa

29 Please see also https://github.com/suchowan/a_converter/blob/master/doc/dozenal_com/univunit-e.pdf for details. A web-based unit converter is available at http://hosi.org/cgi-bin/conv.cgi . This converter also teaches us the representation of units that belong to various unit systems.

30 'harmon'($_{\pm}$h), 'nic'($_{\pm}$n), 'looloh'[35]($_{\pm}$l, 'l' can also be a cursive 'ℓ' (x2113), the suffix 'h' representing the Harmonic System's identity), and 'nohm'($_{\natural}\Omega$) constitutes a quartet.

31 The unit of thermodynamic temperature has been changed. The new unit is one-1,0000;th of the old unit in the paper http://dozenal.com along with the introduction of the Earth local extension.

32 If we adopt the elementary charge as one of the definition constants, $_{\pm}\Omega$ is used in substitution for $_{\natural}\Omega$.

33 The unit symbol E (Ørsted) is associated with the CGS system. In this paper, we adopt metric unit names based on the scientists' names as is.

However, under the Harmonic System, an alternative proposal suggests replacing these units with the names of Muses bearing the same initials — namely, **N**ewton→**Nete**, **P**ascal→(Polymnia→)**Polym**, **C**oulomb→**Clio**, **A**mpere→**Aoide**, **Ø**rsted→**Erato**, **T**esla→**Thalia**, and **K**elvin→**Kalliope**. This proposal has two advantages: (1) it does not honor any individual, and (2) it allows the omission of redundant 'harmonic' terms[16]. The unit converter for this proposal is available at http://hosi.org/cgi-bin/conv_muse.cgi.

This proposal also renames units for which no corresponding Muse is found, such as **J**oule→**Juno**, **W**att→(Walküre→)**Walku**, **naper**→(Nephelē→)**nephe**, **dirac**→**diana**, and **Ω**hm→**Ω**(**Omega**). Since no suitable Muse exists for Joule, Watt, or naper, the proposal instead borrows names from Roman, Norse, and Greek mythology. Moreover, because of the electromagnetic symmetry required to pair $_{\natural}\Omega$ and Ω_2 (see the 3rd part of p.19), 'Ω (Omega)' is adopted without a Muse equivalent.

Non-coherent	defining constants	wave number	R_∞	10,973,731.568157/m (is called 'Rydberg')
		velocity	c_0 or ♮ γ	299,792,458 m/s (defined, and is called 'light')
		action	$\hbar$	$6.62607015 \times 10.^{-34.}$Js/2π(is called 'quantum')
		heat capacity	k_B	$1.380649 \times 10.^{-23.}$J/K (is called 'Boltzmann')
	supplementary constants	the total solid angle of a hypersphere	Ω_k	$\dfrac{2\pi^{\frac{k+1}{2}}}{\Gamma(\frac{k+1}{2})}$ rad^k k=0,1, 2 Ω_0=2 Ω_1=2π rad (is called 'cycle') Ω_2=4π sr (is called 'turn')
		logarithm of an integer	Ʊ$_k$	log(2^k) k=1(bit), z(figure), 4(nibble), 8(byte), .. z=$\log_2$(12.)
		amount of substance	±mol	132.007620 mol (=$12.^{24.}/ N_\mathrm{A}$) (±mol may be called 'universal mol')
		elementary charge	e	$1.6021766340 \times 10.^{-19.}$C (=$\sqrt{\frac{\alpha h}{\Omega_n}}$) ($e$ is called 'electron')

Table 5 Physical, material and astronomical constants[34]

---

[39] The part enclosed with'[]' can be omitted in Table 7 and Table 8.

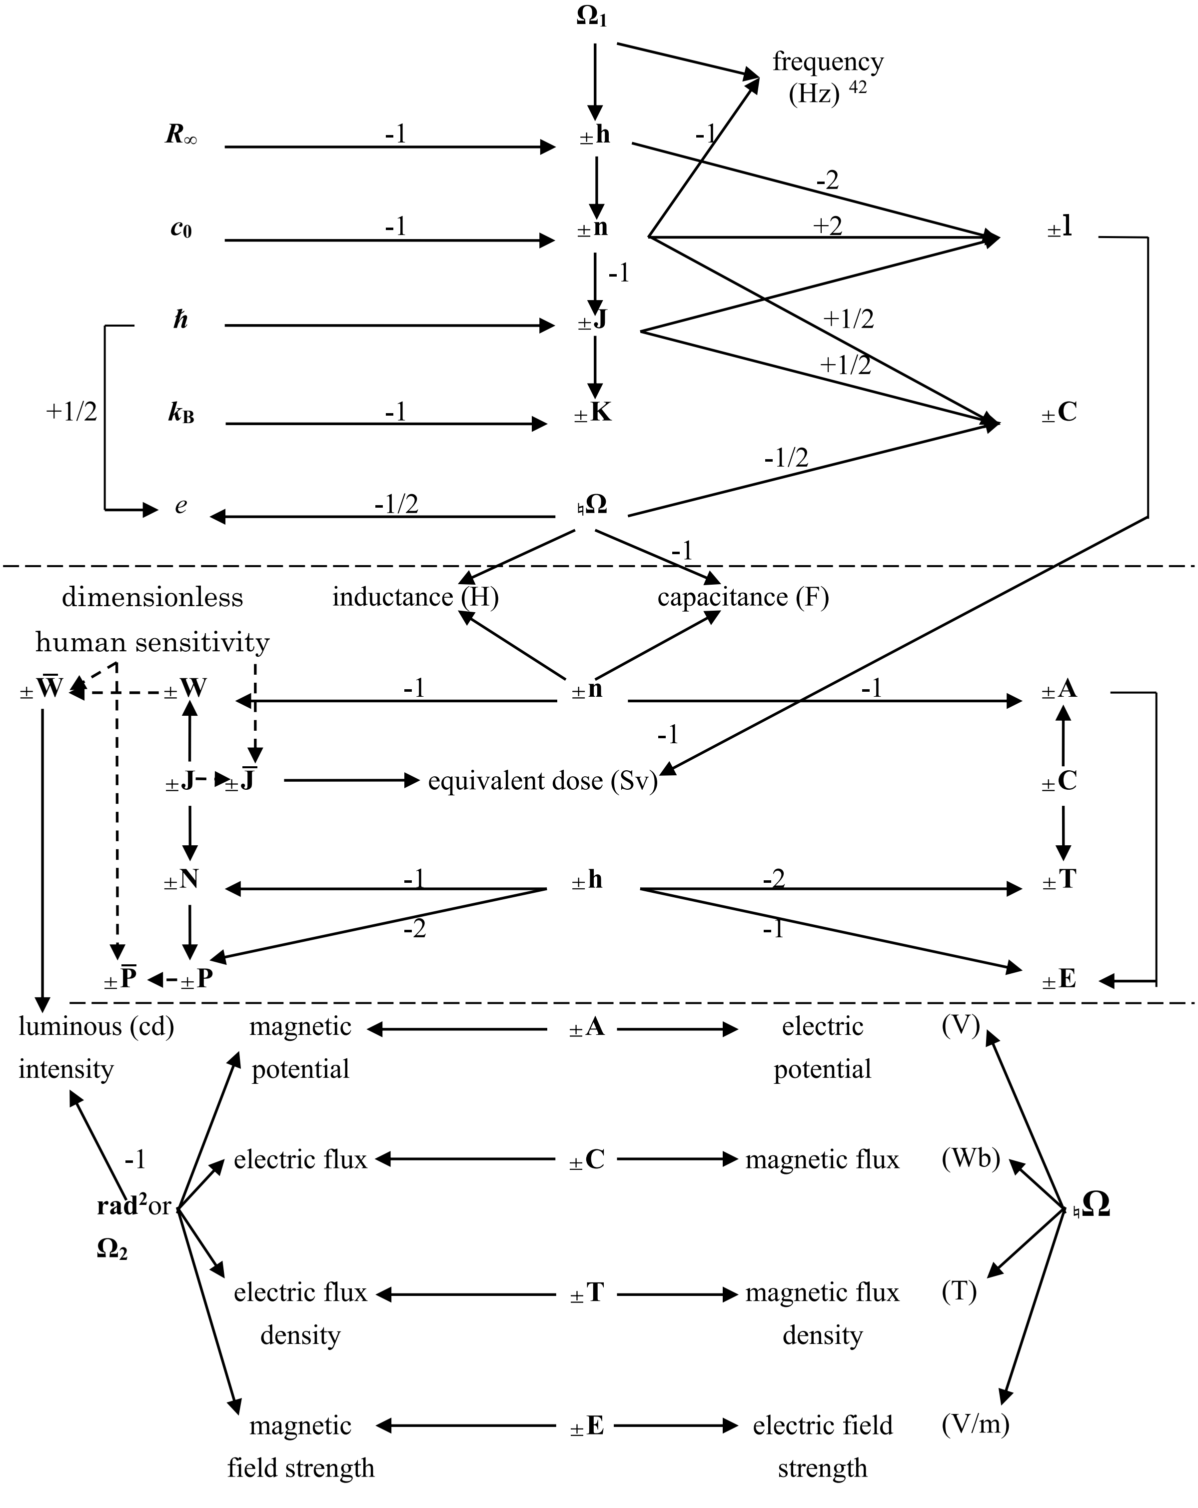
[40] This is the notation explained at the end of Appendix C.

W̄ corresponds to 1;di-cosmic photon energy(540.THz) / nic and 115.667212 lumen.

[41] Units for quantity weighted by dimensionless human sensitivity are indicated by 'effective' and symbolled by overline.

W̄ corresponds to 1;di-cosmic photon energy(540.THz) / nic and 115.667212 lumen.

E. Relation of Units and Dimensions



42 The units enclosed with‘()’ are units of SI.

Force between electrical quantities	$f = \frac{1}{\epsilon_0}\frac{\Omega_2 Q}{4\pi r^2}Q' = \Omega_n c_0 \frac{QQ'}{r^2}$
Force between electrical currents	$df = \mu_0 \frac{\Omega_2 I}{2\pi r}I' = \frac{2\Omega_n}{c_0}\frac{II'}{r}$
Lorentz force	$\mathbf{F} = Q(\mathbf{E} + \mathbf{v}\times\mathbf{B})$
Energy density of an electromagnetic field	$u = \frac{1}{2\Omega_2}(\mathbf{E}\cdot\mathbf{D} + \mathbf{H}\cdot\mathbf{B})$
Poynting vector	$\mathbf{S} = \frac{1}{\Omega_2}\mathbf{E}\times\mathbf{H}$
Electromagnetic induction law	$\nabla\times\mathbf{E} = -\frac{\partial\mathbf{B}}{\partial t}$
	$\nabla\times\mathbf{H} = +\frac{\partial\mathbf{D}}{\partial t} + \Omega_2\mathbf{J}$
Gauss' theorem (differential form)	$\begin{cases}\nabla\cdot\mathbf{D} = \Omega_2\rho \\ \nabla\cdot\mathbf{B} = 0\end{cases}$
Charge conservation law	$\nabla\cdot\mathbf{J} + \frac{\partial\rho}{\partial t} = 0$
Scalar potential	$\mathbf{E} = -\nabla\phi - \frac{\partial\mathbf{A}}{\partial t}$
Vector potential	$\mathbf{B} = +\nabla\times\mathbf{A}$
Equation that satisfies the potential	$\begin{cases}\Delta\phi - \epsilon_0\mu_0\frac{\partial^2\phi}{\partial t^2} = -\Omega_2\frac{\rho}{\epsilon_0} \\ \Delta\mathbf{A} - \epsilon_0\mu_0\frac{\partial^2\mathbf{A}}{\partial t^2} = -\Omega_2\mu_0\mathbf{J}\end{cases}$

$$\text{Constant} \approx \Omega_0^n \times 12^m, \text{ where } n \in \{0, \pm 1\}, m \in \mathbb{Z}$$

F. Ratios of fundamental physical constants

F.1. The fine structure constant and the elementary charge

The fine structure constant, α, a dimensionless quantity, was originally introduced for the purpose to explain the fine structure spectral emission lines.

$$\alpha = \frac{e^2}{4\pi\varepsilon_0 c_0 \hbar} \tag{X}$$

By multiplying both sides of Eq. (X) by $\frac{c_0\hbar}{r^2}$, we get

$$\alpha \frac{c_0\hbar}{r^2} = \frac{1}{4\pi\varepsilon_0}\frac{e^2}{r^2} \tag{E}$$

The right side of Eq. (E) expresses the Coulomb force acting between two elementary charges (i.e., the electrical charge of an electron) separated by a distance of *r*. The left side indicates that this force is proportional to $\frac{c_0\hbar}{r^2}$ by a factor of α. For this reason, the fine structure constant, α, can be interpreted as a dimensionless quantity that represents the strength of electromagnetic interaction.

The value of the fine structure constant, α, is close to $10;^{-2}(12.^{-2})$.

DOZENAL

$$\alpha = \frac{1}{\mathrm{E5;052258E7}} = 1;073994047 \times 10;^{-2}$$

DECIMAL (10;)

$$\alpha = \frac{1}{137.03599918} = 1.050818769 \times 12^{-2}$$

Therefore, the ratio of the elementary charge, *e*, and "the dimensioned quantity of charge, which is derived from the speed of light in vacuum, c_0, and the quantum of action,$\hbar$" is:

DOZENAL

$$\alpha^{\frac{1}{2}} = \frac{e}{\sqrt{4\pi\varepsilon_0 c_0 \hbar}} = 1;0374439\mathrm{E}1 \times 10;^{-1}$$

DECIMAL (11;)

$$\alpha^{\frac{1}{2}} = \frac{e}{\sqrt{4\pi\varepsilon_0 c_0 \hbar}} = 1.025094517 \times 12^{-1}$$

F.2. The Rydberg constant and the Bohr radius

The deviation of the fine structure constant, α, from an integer power of twelve is nearly the same as the deviation of 4π from twelve.

DOZENAL

$$4\pi = 1;069683171 \times 10;^{1} = \frac{1}{\mathrm{E5;6150822}} \times 10;^{3}$$

DECIMAL (12;)

$$4\pi = 1.047197551 \times 12^{1} = \frac{1}{137.5098708} \times 12^{3}$$

The ratio of the Bohr radius, a_B, and "the dimensioned quantity of length, L=R_∞^{-1}, where R_∞ is the Rydberg constant" is:

DOZENAL

$$\frac{a_B}{L} = \frac{\alpha}{4\pi}(\text{strict}) = 1;005\text{E}85684 \times 10;^{-3}$$

DECIMAL (13;)

$$\frac{a_B}{L} = \frac{\alpha}{4\pi}(\text{strict}) = 1.003458009 \times 12^{-3}$$

F.3. The electron mass and the unified atomic mass unit

The ratio of the mass of an electron, m_e, and "the dimensioned quantity of mass, M, which is derived from L, the speed of light in vacuum, c_0, and the quantum of action$\hbar$,"

$$M = \frac{\hbar}{c_0 L}, \tag{14;}$$

is:

DOZENAL

$$\frac{m_e}{M} = \frac{4\pi}{\alpha^2}(\text{strict}) = 0;\text{E}4692218 \times 10;^{5}$$

DECIMAL (15;)

$$\frac{m_e}{M} = \frac{4\pi}{\alpha^2}(\text{strict}) = 0.948359448 \times 12^{5}$$

The ratio of the mass of an electron, m_e and the unified atomic mass unit, u, is:

DOZENAL

$$\frac{m_e}{u} = \frac{1}{107\text{X};\text{X}7\text{E}4} = \frac{4\pi}{\alpha^2} \times 0.\text{EEE}2\text{E}66 \times 10;^{-8}$$

DECIMAL (16;)

$$\frac{m_e}{u} = \frac{1}{1822.8885} = \frac{4\pi}{\alpha^2} \times 0.9995641 \times 12^{-8}$$

This ratio corresponds to the ratio of typical nuclear energy and chemical energy. The deviations of ratio Eq. (15;) and ratio Eq. (16;) from multiples of an integer power of twelve are near to the same magnitude. Therefore:

DOZENAL	DECIMAL	
$\frac{u}{M} = 1;0009060\text{E} \times 10;^{8}$	$\frac{u}{M} = 1.00043606 \times 12^{8}$	(17;)

F.4. The Planck length

The ratio of the general expression of the Planck length, $\sqrt{\frac{Gh}{c_0^3}}$, and L is close to 2 when factors of multiples of an integer power of twelve are eliminated.

DOZENAL

$$\sqrt{\frac{G\hbar}{c_0^3}}/L = 2 \times 1;0222\mathrm{E} \ \times 10;^{-22}$$

DECIMAL (18;)

$$\sqrt{\frac{G\hbar}{c_0^3}}/L = 2 \times 1.01519 \ \times 12^{-26}$$

Taking the expression $\sqrt{\frac{G\hbar}{c_0^3\alpha}}$, which has been adjusted[43] by the fine structure constant, α, in order to express the tensile force in a superstring in terms of the Planck length, the ratio of the adjusted Planck length and *L* then becomes:

DOZENAL

$$\sqrt{\frac{G\hbar}{c_0^3\alpha}}/L = 2 \times 0;\mathrm{EX}737 \ \times 10;^{-21}$$

DECIMAL (19;)

$$\sqrt{\frac{G\hbar}{c_0^3\alpha}}/L = 2 \times 0.99034 \ \times 12^{-25}$$

The Gravitic Universal Unit System uses 140.0 to approximate α^{-1}(=137.03599918). Because 1,0017;(20,755.=35.×593.) is divisible with 2E;(35.), we can approximate *G* by Eq.(1X;) about 6.51 times standard deviation error of CODATA(2018):

$$G \fallingdotseq \frac{(5\times7)^2 \cancel{\times} 415;^2 c_0^3}{\cancel{5\times7\times\hbar R_\infty^2}} \times 10;^{-4X} = \frac{5\times7\times415;^2 c_0^3}{\hbar R_\infty^2} \times 10;^{-4X} \quad (1X;)$$

43 See E. Witten, ‘Reflections on the fate of spacetime’ p. 24. in April 11X4;(1996.) *Physics Today*.
